AniGARD VF & EdgeGARD HF Pre-Filter Removal/Cleaning

Recommended cleaning intervals: This depends on usage and will be determined by the facility that the unit being used in for the cleaning intervals. Check regularly or during certification.

Tools needed:

- Tape measure:
- Marker:
- Vacuum (HEPA vac):
- Disinfectant
- Proper PPE
The pre-filter for the unit is located on the top of the unit.

The panel that covers this filter is used to balance the airflow of the unit.

Do **NOT** remove the sliding panel without first marking or measuring the opening as shown. This will have influence on the flow of the unit.

Once marked/measured, loosen the wing nuts (counterclockwise) that hold the panel and slide the panel back. The pre-filter is now accessible to remove for cleaning.

Remove pre-filter material by lifting from the side edge.

With the pre-filter now removed, use a vacuum to remove any large debris. If further cleaning is required, use a mild soap in warm water to finish the cleaning. Rinse thoroughly and let dry prior to installing back in the unit. A towel may be used to quicken the drying process by patting the towel on the pre-filter.

Reassemble by inserting the pre-filter into the channel, then slide the top to the marked locations or measure the opening. Tighten the wing nuts hand tight by turning clockwise.
